Original Derived Variables (See diagram for graphic illustration)

1. mx23: maximum near wall thickness is the maximum of all available (up to eleven) distances between pairs of points on the near wall, using splined data when five or more points were actually read in an interface, or using only observed data when four or less points were read.

There is a \*mx23 for every site, where A\* $\equiv$  is one of the prefixes listed in Appendix A, corresponding to the specific site.

Schematic Overview of Carotid Artery B-Mode Ultrasound Measurements

- Interfaces:
- 1- Boundary between the periadventitia and adventitia of the near wall (not measured)
  - 2- Boundary between the adventitia and media of the near wall
  - 3- Boundary between the intima of the near wall and the blood
  - 4- Boundary between blood and intima of the far wall
  - 5- Boundary between media and adventitia of the far wall
  - 6- Boundary between adventitia and periadventitia of the far wall (not measured)

Max 23 = B-A; Max 45 = D-C; Min 34 = H-G

The extracranial carotid system is divided into one-centimeter segments: I = internal carotid; II = carotid bifurcation; III = common carotid. A maximum of eleven measurements is made by URC readers on each arterial wall interface, in each arterial segment. These measurements are placed equidistant at 1 millimeter intervals, represented by the eleven points placed on interface B2 on the internal carotid. Also shown on this schematic is the definition of a maximum and a minimum wall thickness variable.
